Lecture 5-1: Calibration

Contents

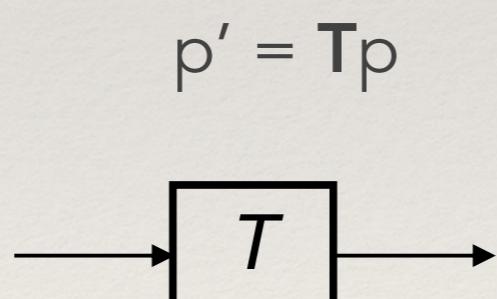

- ❖ **Geometric transformation**
- ❖ **Camera matrix**
- ❖ **Camera calibration**

Transformation

- ❖ Parametric (global) transformations
 - ❖ Transformation T is a coordinate-changing machine: $p' = T(p)$
 - ❖ What does it mean that T is global?
 - ❖ T is the same for any point p
 - ❖ T can be described by just a few numbers (parameters)
 - ❖ For linear transformations, we can represent T as a matrix

$$\mathbf{p} = (x, y)$$

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \mathbf{T} \begin{bmatrix} x \\ y \end{bmatrix}$$

$$\mathbf{p}' = (x', y')$$

Scaling

- ❖ *Scaling* a coordinate means multiplying each of its components by a scalar
- ❖ *Uniform scaling* means this scalar is the same for all components:

Scaling

- ❖ *Non-uniform scaling*: different scalars per component

Scaling

- ❖ Scaling operation:

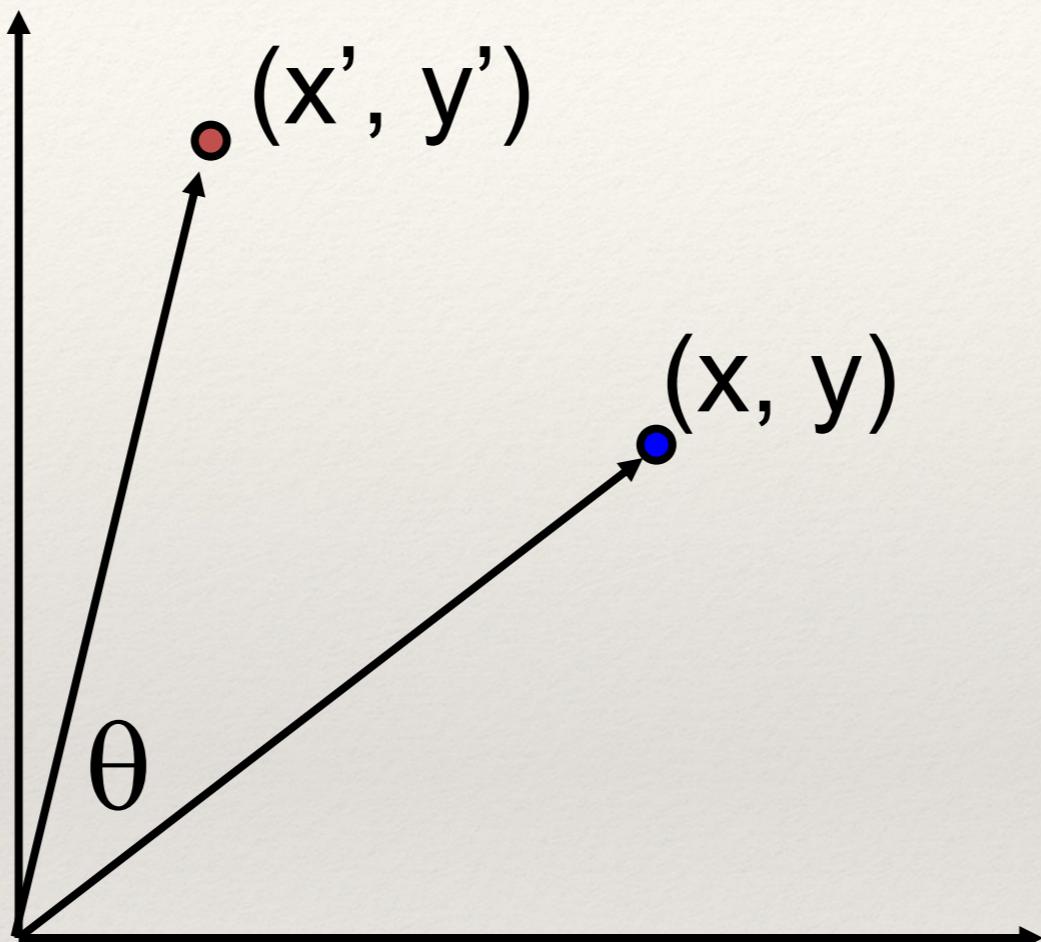

$$x' = ax$$

$$y' = by$$

- ❖ Or, in matrix form:

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \underbrace{\begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix}}_{\text{scaling matrix } S} \begin{bmatrix} x \\ y \end{bmatrix}$$

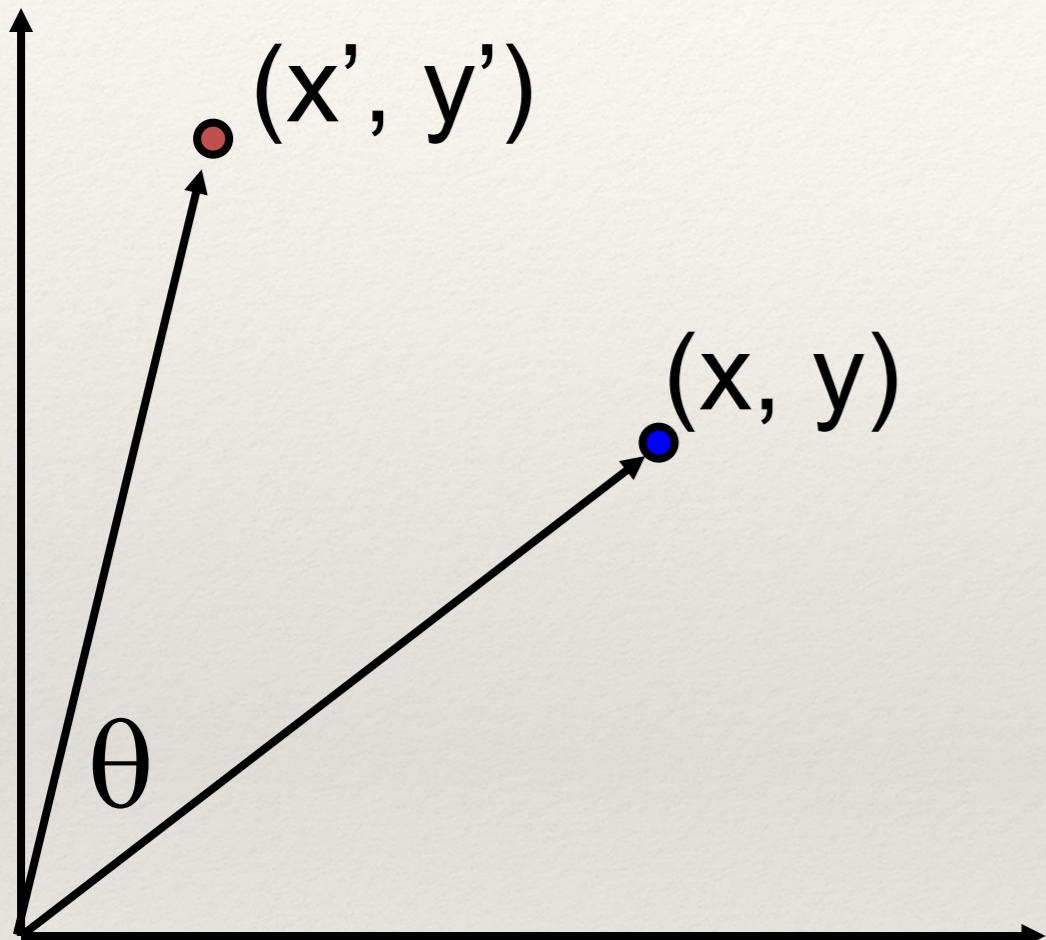

2-D Rotation

$$x' = x \cos(\theta) - y \sin(\theta)$$

$$y' = x \sin(\theta) + y \cos(\theta)$$

2-D Rotation

Polar coordinates...

$$x = r \cos (\phi)$$

$$y = r \sin (\phi)$$

$$x' = r \cos (\phi + \theta)$$

$$y' = r \sin (\phi + \theta)$$

Trig Identity...

$$x' = r \cos(\phi) \cos(\theta) - r \sin(\phi) \sin(\theta)$$

$$y' = r \sin(\phi) \cos(\theta) + r \cos(\phi) \sin(\theta)$$

Substitute...

$$x' = x \cos(\theta) - y \sin(\theta)$$

$$y' = x \sin(\theta) + y \cos(\theta)$$

$$x' = x \cos(\theta) - y \sin(\theta)$$

$$y' = x \sin(\theta) + y \cos(\theta)$$

2-D Rotation

- ❖ This is easy to capture in matrix form:

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \underbrace{\begin{bmatrix} \cos(\theta) & -\sin(\theta) \\ \sin(\theta) & \cos(\theta) \end{bmatrix}}_{\mathbf{R}} \begin{bmatrix} x \\ y \end{bmatrix}$$

- ❖ Even though $\sin\theta$ and $\cos\theta$ are nonlinear functions of θ
 - ❖ x' is a linear combination of x and y
 - ❖ y' is a linear combination of x and y
- ❖ What is the inverse transformation?
 - ❖ Rotation by $-\theta$
 - ❖ For rotation matrices $\mathbf{R}^{-1} = \mathbf{R}^T$

Basic 2D transformations

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} s_x & 0 \\ 0 & s_y \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

Scale

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} 1 & \alpha_x \\ \alpha_y & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

Shear

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos\Theta & -\sin\Theta \\ \sin\Theta & \cos\Theta \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

Rotate

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Translate

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Affine

Affine is any combination of translation, scale, rotation, and shear

Affine Transformations

- ❖ Affine transformations are combinations of
 - ❖ Linear transformations, and
 - ❖ Translations
- ❖ Properties of affine transformations:
 - ❖ Lines map to lines
 - ❖ Parallel lines remain parallel
 - ❖ Ratios are preserved
 - ❖ Closed under composition

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

or

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Projective transformations

- ❖ Projective transformations are combos of
 - ❖ Affine transformations, and
 - ❖ Projective warps
- ❖ Properties of projective transformations:
 - ❖ Lines map to lines
 - ❖ Parallel lines do not necessarily remain parallel
 - ❖ Ratios are not preserved
 - ❖ Closed under composition
 - ❖ Models change of basis
 - ❖ Projective matrix is defined up to a scale (8 DOF)

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

2D transformations

Isometries

- Isometries are transformations that preserve Euclidean distance
- Invariants: length (the distance between two points), angle (the angle between two lines), and area

$$\begin{pmatrix} x' \\ y' \\ 1 \end{pmatrix} = \begin{bmatrix} \epsilon \cos \theta & -\sin \theta & t_x \\ \epsilon \sin \theta & \cos \theta & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{pmatrix} x \\ y \\ 1 \end{pmatrix}$$

where $\epsilon = \pm 1$.

$$\mathbf{x}' = H_E \mathbf{x} = \begin{bmatrix} R & \mathbf{t} \\ \mathbf{0}^\top & 1 \end{bmatrix} \mathbf{x}$$

2D transformations

Similarity

- Is an isometry composed with an isotropic scaling

$$\begin{pmatrix} x' \\ y' \\ 1 \end{pmatrix} = \begin{bmatrix} s \cos \theta & -s \sin \theta & t_x \\ s \sin \theta & s \cos \theta & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{pmatrix} x \\ y \\ 1 \end{pmatrix}$$

- Invariants: angle, ratio of length, ratio of area

$$\mathbf{x}' = H_S \mathbf{x} = \begin{bmatrix} sR & t \\ 0^T & 1 \end{bmatrix} \mathbf{x}$$

- Invariants: parallel lines; ratio of lengths of parallel line segments; ratio of area

$$\begin{pmatrix} x' \\ y' \\ 1 \end{pmatrix} = \begin{bmatrix} a_{11} & a_{12} & t_x \\ a_{21} & a_{22} & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{pmatrix} x \\ y \\ 1 \end{pmatrix}$$

$$\mathbf{x}' = H_A \mathbf{x} = \begin{bmatrix} A & \mathbf{t} \\ \mathbf{0}^\top & 1 \end{bmatrix} \mathbf{x}$$
$$A = R(\theta) R(-\phi) D R(\phi)$$

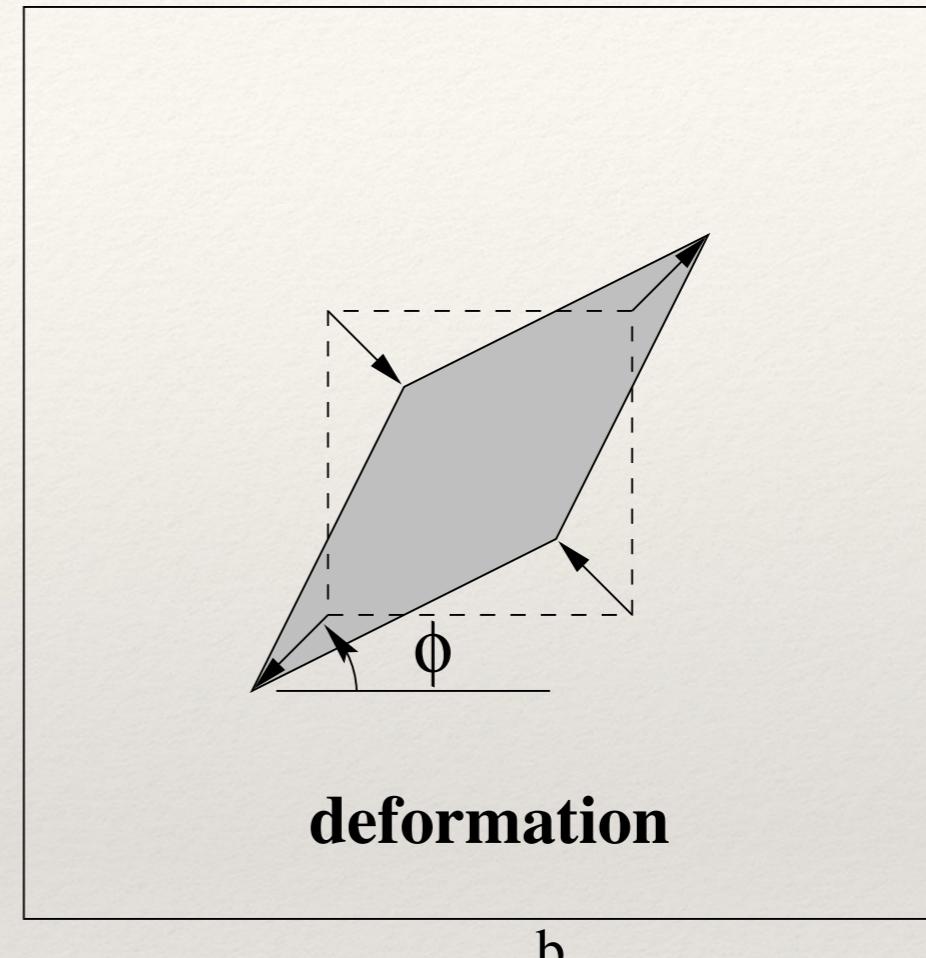

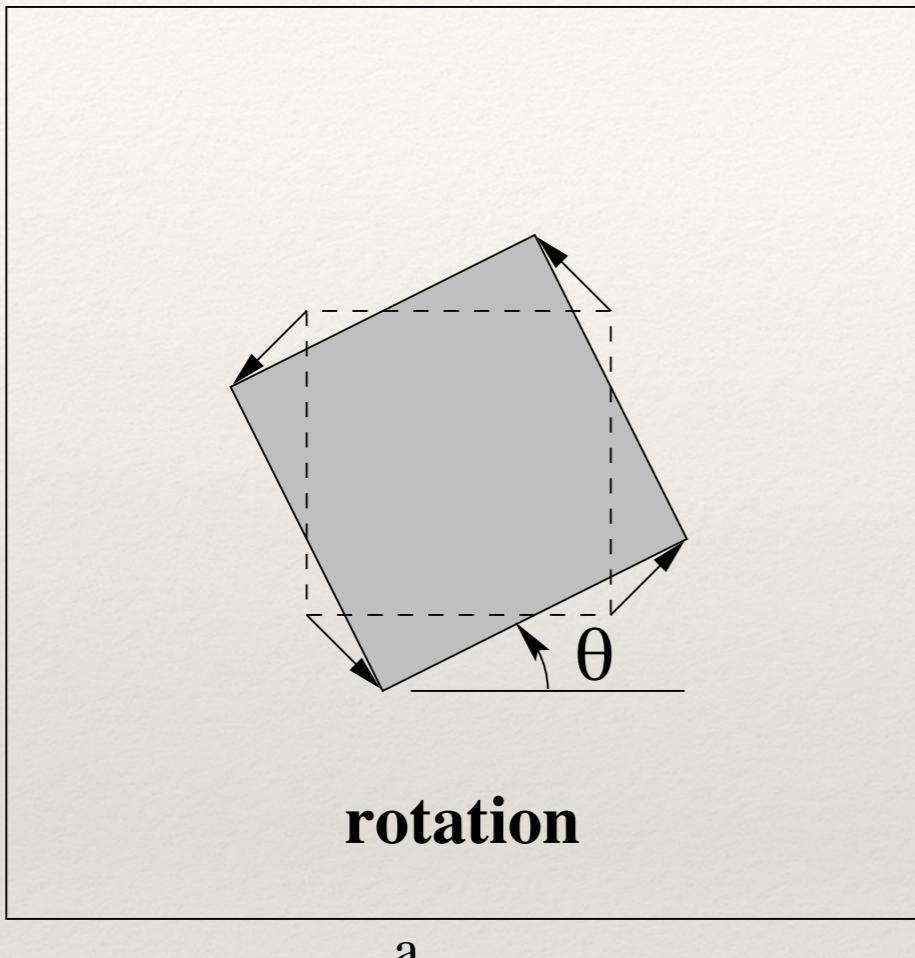

Fig. 2.7. **Distortions arising from a planar affine transformation.** (a) Rotation by $R(\theta)$. (b) A deformation $R(-\phi) D R(\phi)$. Note, the scaling directions in the deformation are orthogonal.

2D transformations

Projective (Homography)

- A general non-singular linear transformation of *homogeneous* coordinates
- Invariants: cross ratio of four collinear points

$$\mathbf{x}' = \mathbf{H}_P \mathbf{x} = \begin{bmatrix} \mathbf{A} & \mathbf{t} \\ \mathbf{v}^T & v \end{bmatrix} \mathbf{x}$$
$$\mathbf{v} = (v_1, v_2)^T$$

2D transformations

For ideal point $(x_1, x_2, 0)$

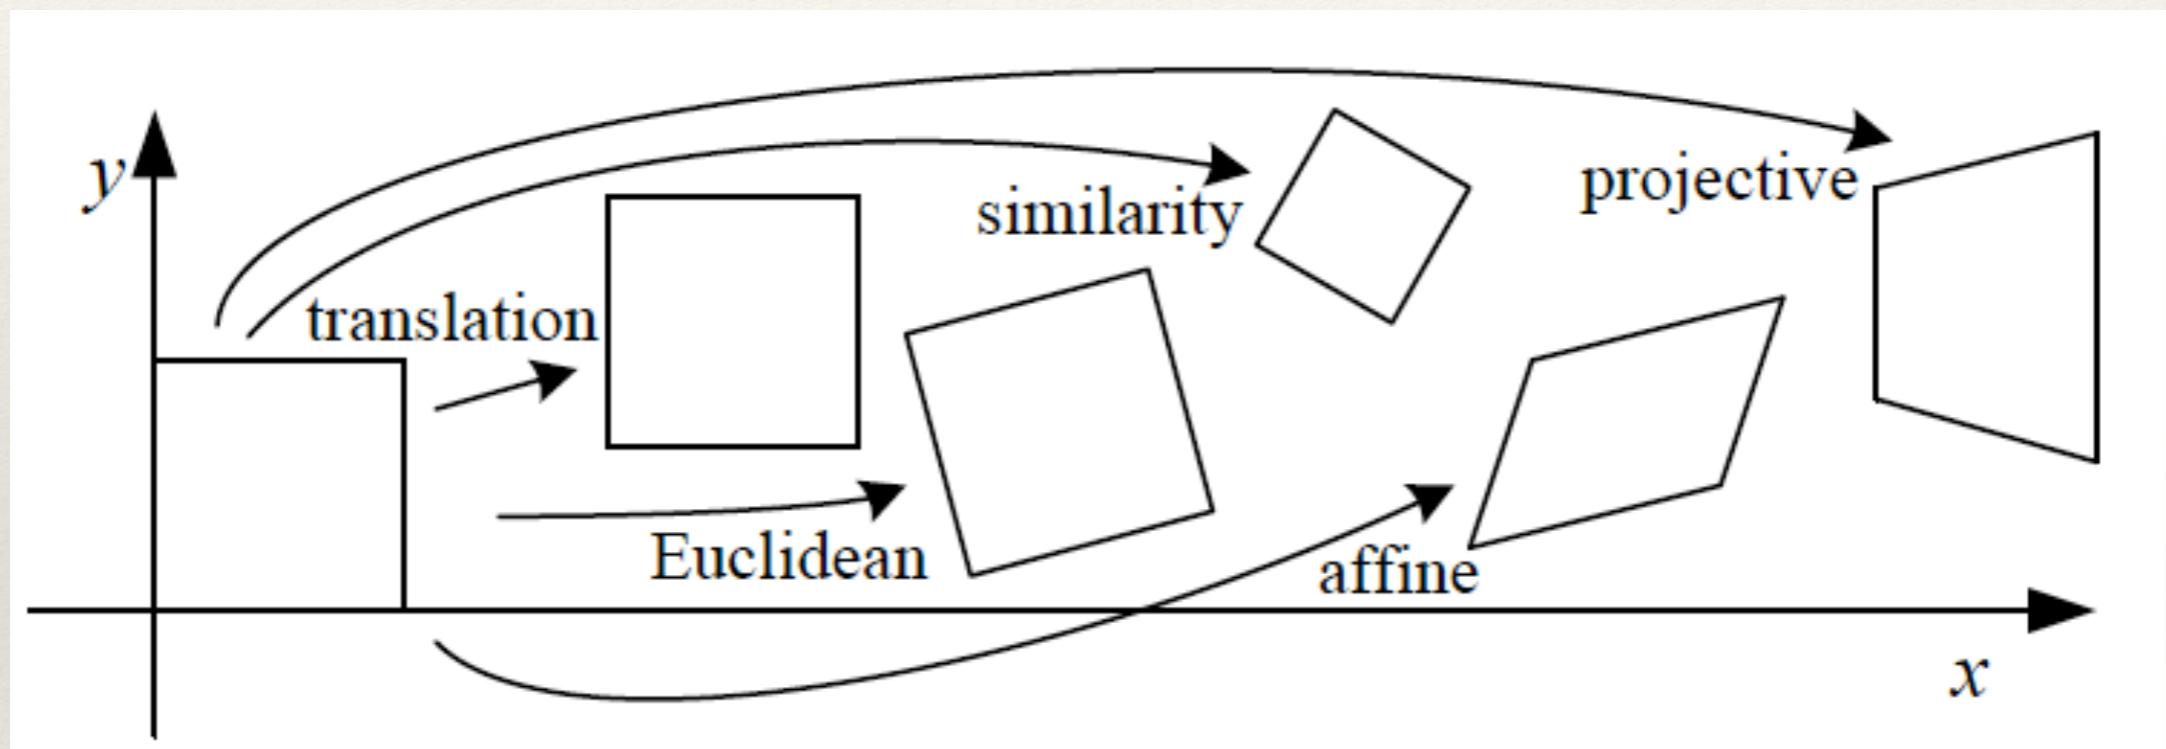

$$\begin{bmatrix} A & t \\ 0^T & 1 \end{bmatrix} \begin{pmatrix} x_1 \\ x_2 \\ 0 \end{pmatrix} = \begin{pmatrix} A \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} \\ 0 \end{pmatrix}$$

Affine

$$\begin{bmatrix} A & t \\ v^T & v \end{bmatrix} \begin{pmatrix} x_1 \\ x_2 \\ 0 \end{pmatrix} = \begin{pmatrix} A \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} \\ v_1 x_1 + v_2 x_2 \end{pmatrix}$$

- Data: $(x_1, y_1), \dots, (x_n, y_n)$
- Line equation: $y_i = mx_i + b$
- Find (m, b) to minimize

$$E = \sum_{i=1}^n (y_i - mx_i - b)^2$$

$$E = \sum_{i=1}^n \left(\begin{bmatrix} x_i & 1 \end{bmatrix} \begin{bmatrix} m \\ b \end{bmatrix} - y_i \right)^2 = \left\| \begin{bmatrix} x_1 & 1 \\ \vdots & \vdots \\ x_n & 1 \end{bmatrix} \begin{bmatrix} m \\ b \end{bmatrix} - \begin{bmatrix} y_1 \\ \vdots \\ y_n \end{bmatrix} \right\|^2 = \|\mathbf{Ap} - \mathbf{y}\|^2$$

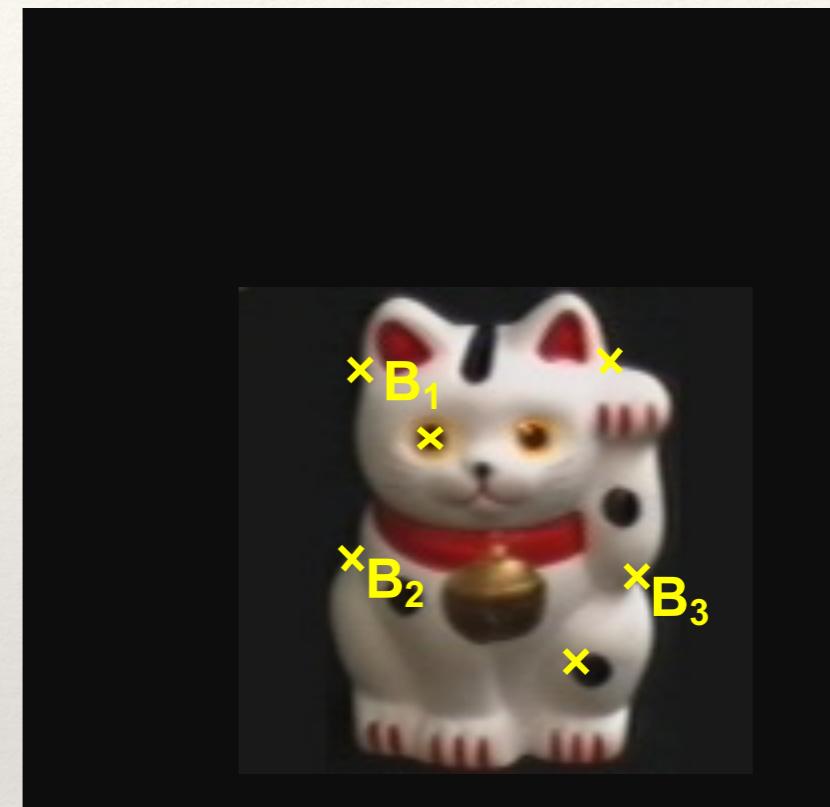

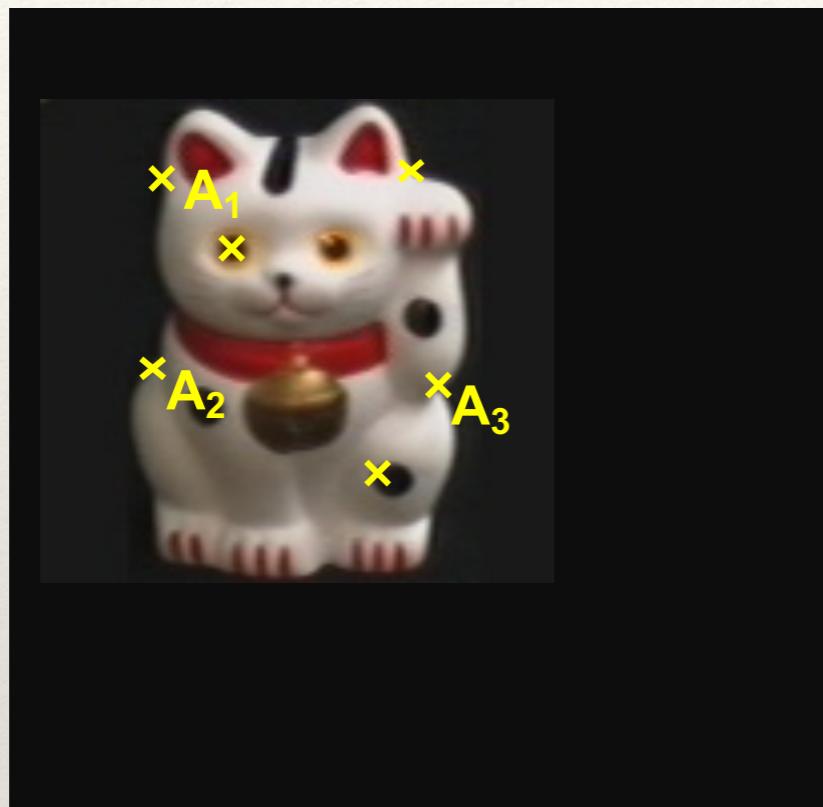

$$= \mathbf{y}^T \mathbf{y} - 2(\mathbf{Ap})^T \mathbf{y} + (\mathbf{Ap})^T (\mathbf{Ap})$$

```
Matlab: p = A \ y;
Python:
p = np.linalg.lstsq(A,y)[0]
```

$$\mathbf{A}^T \mathbf{Ap} = \mathbf{A}^T \mathbf{y} \Rightarrow \mathbf{p} = (\mathbf{A}^T \mathbf{A})^{-1} \mathbf{A}^T \mathbf{y} \quad (\text{Closed form solution})$$

What is least squares doing?

- Given 3D point evidence, find best \mathbf{M} which minimizes error between estimate (\mathbf{p}') and known corresponding 2D points (\mathbf{p}).

What is least squares doing?

- Best \mathbf{M} occurs when $\mathbf{p}' = \mathbf{p}$, or when $\mathbf{p}' - \mathbf{p} = 0$
- Form these equations from all point evidence

How many points do I need to fit the model?

Think 3:

- Rotation around x
 - Rotation around y
 - Rotation around z

How many points do I need to fit the model?

$$\mathbf{x} = \mathbf{K}[\mathbf{R} \quad \mathbf{t}] \mathbf{X}$$

Degrees of freedom?

M is 3×4 , so 12 unknowns, but projective scale ambiguity – 11 deg. freedom.
 One equation per unknown \rightarrow 5 1/2 point correspondences determines a solution
 (e.g., either u or v).

More than 5 1/2 point correspondences -> overdetermined, many solutions to \mathbf{M} . Least squares is finding the solution that best satisfies the overdetermined system.

Why use more than 6? Robustness to error in feature points.

Calibration with linear method

- ❖ Advantages
 - ❖ Easy to formulate and solve
 - ❖ Provides initialization for non-linear methods
- ❖ Disadvantages
 - ❖ Doesn't directly give you camera parameters
 - ❖ Doesn't model radial distortion
 - ❖ Can't impose constraints, such as known focal length
- ❖ Non-linear methods are preferred
 - ❖ Define error as difference between projected points and measured points
 - ❖ Minimize error using Newton's method or other non-linear optimization

Can we factorize M back to $K[R|T]$?

- ❖ Yes
- ❖ We can directly solve for the individual entries of $K[R|T]$.

Can we factorize M back to K [R | T]?

- ❖ Yes
- ❖ We can also use *RQ* factorization (not QR)
 - ❖ R in RQ is not rotation matrix R; crossed names!
- ❖ *R* (right diagonal) is K
- ❖ *Q* (orthogonal basis) is R.
- ❖ T, the last column of [R | T], is $\text{inv}(K) * \text{last column of } M$.
- ❖ But you need to do a bit of post-processing to make sure that the matrices are valid. See <http://ksimek.github.io/2012/08/14/decompose/>

Recovering the camera center

$$\mathbf{x} = \mathbf{K}[\mathbf{R} \quad \mathbf{t}] \mathbf{X}$$

$$w \begin{bmatrix} u \\ v \\ 1 \end{bmatrix} = \begin{bmatrix} \alpha & s & u_0 \\ 0 & \beta & v_0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} r_{11} & r_{12} & r_{13} \\ r_{21} & r_{22} & r_{23} \\ r_{31} & r_{32} & r_{33} \end{bmatrix} \begin{bmatrix} t_x \\ t_y \\ t_z \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

This is not the camera center C.

It is $-\mathbf{R}\mathbf{C}$, as the point is rotated before t_x , t_y , and t_z are added

So we need
 $-\mathbf{R}^{-1} \mathbf{K}^{-1} \mathbf{m}_4$ to get C.

$$\begin{bmatrix} su \\ sv \\ s \end{bmatrix} = \begin{bmatrix} * & * & * \\ * & * & * \\ * & * & * \end{bmatrix} \mathbf{Q} \begin{bmatrix} \mathbf{m}_4 \\ X \\ Y \\ Z \\ 1 \end{bmatrix}$$

This is $\mathbf{t} \times \mathbf{K}$

So $\mathbf{K}^{-1} \mathbf{m}_4$ is \mathbf{t}

\mathbf{Q} is $\mathbf{K} \times \mathbf{R}$.

So we just need $-\mathbf{Q}^{-1} \mathbf{m}_4$
